**THE FIRST BULGARIAN MAREOGRAPH STATION
IN ANTARCTIC, LIVINGSTON ISLAND**

Borislav Alexandrov (BG)

SUMMARY

This paper describes the activities of creating the first Bulgarian Station for measurements of sea level changes in Antarctica in December 2017. After approval by the Bulgarian Antarctic Institute for the idea of installing the station in the Bulgarian Antarctic Base, the necessary organization for the installation and start of the station in working mode was made. The process of transporting and strengthening the seabed of the sensor proved to be a serious and difficult task for the working team because of the heavy weather conditions and the heavy ice in the installation area.

Keywords: Antarctica, sea level, measurements of sea level changes
